Field of the Invention This invention relates to a fuel tank, more specifically a fuel tank that is usable as a fuel tank for two or more fuel systems and is mounted in a vehicle in such a manner as to be able to protect passengers in a side impact collision. 2. Description of the Related Art Fuel systems are mounted in vehicles for storing gasoline or diesel fuel.

Such fuel systems have a volume that is at least 10 times larger than that of other components, such as an engine and an air-conditioning system, and accordingly, when the vehicle is impacted by another vehicle or object, the large fuel tank may act as a buffer or deformation element, and energy that is transmitted to the fuel tank is accumulated therein. One of the methods for reducing the damage that is transmitted to a fuel tank is to secure the fuel tank to the vehicle with a suitable material and to support the fuel tank with a suitable structure. In a fuel tank structure that is mounted in a vehicle in such a manner as to be able to absorb impact energy, the fuel tank is supported by a center pillar and side walls that are disposed on opposite sides of the center pillar. When there is a side impact, the center pillar is deformed and the fuel tank is elastically deformed due to the deformation of the center pillar, and the impact energy is absorbed by the elastic deformation of the fuel tank. However, since a fuel tank, which is conventionally mounted in a vehicle, is generally mounted at a position in which it is hidden from view, the elastic deformation of the fuel tank does not always cause the passengers to be safely protected. For example, when the elastic deformation of the fuel tank is in a range of about 10%, since it is difficult to perceive the deformation of the fuel tank, the passengers may not be aware of the occurrence of the deformation. As a result, even when the fuel tank is deformed, the passengers may not be protected. Furthermore, when the fuel tank is deformed to the extent of causing the fuel tank to be tilted, the gaskets that are disposed on opposite sides of the fuel tank may come off and the fuel that is stored in the fuel tank may leak out. Polymers are used as protective packaging materials for many goods to protect the goods from damage caused by
